

ABSTRACT OF THE DISCLOSURE

It is necessary to switch print settings and color processing tables to optimum ones in accordance with a type of sheet which is used in a printer. In 5 the case of enabling a new sheet to be used, a setting can be easily added without newly forming a whole printer driver. Print set information regarding the new sheet is set into a media script and fetched into a media block via a compiler.

10 Control is made so as to store the print set information from a media database API into a media database. When the new sheet is selected on a driver display screen, the media database is searched from the media database API and print data is formed on 15 the basis of the print set information.
